1. Topic and purpose

Campus Book Club is a static educational website for a student reading club. It introduces the club, suggests two books, displays a weekly timetable and provides a demonstration joining form. The text and design are deliberately short and easy to understand.

2. Site map

All four pages contain the same navigation bar. Every page links directly to Home, Books, Schedule and Join. The Home page also has a Join the club button. Each page has a Top link that returns to its heading.

File	Purpose
index.html	Welcome, book illustration, ordered list and external link.
books.html	Two book articles, unordered lists and a playable chime.
schedule.html	Weekly table with merged rows and columns.
join.html	Practice membership form with all required controls.
style.css	37 lines of custom styling, shared by all pages.
media/ and vendor/	Local SVG image, WAV audio and Bootstrap stylesheet with its license.

3. Running the website

Extract the ZIP first. Open website/index.html in a browser. No installation, server or Internet connection is needed for the pages, styles, image or sound. The external Project Gutenberg link requires Internet access.

4. HTML and CSS requirements

Requirement	Where it is used
HTML5 page structure	All pages: doctype, html, head, charset, viewport, description, title and body.
Semantic elements	All pages: header, nav, main and footer. Home and Schedule: section and aside. Books: article.
Text and links	Headings and paragraphs throughout; strong and em on Home; navigation, Top anchor and external book link.
Images and lists	Home: books.svg with alt text and an ordered list. Books and Schedule: unordered lists.
Table and merging	Schedule: caption, th and td. Library cell uses rowspan="2"; Friday activity uses colspan="2".
Audio	Books: audio controls plays media/chime.wav.
Form controls	Join: text, email, password, number, date, radio, checkbox, select, textarea and submit. Labels identify controls; fieldset groups radio choices.
External CSS and selectors	style.css: element selectors such as body; class selectors .books and .top; grouped selectors; a:hover pseudo-class.
Visual styling and box model	Body font and colours; header background; section padding, margin and border.
Display and positioning	Navigation uses Flexbox. Book articles use Grid. Image uses display:block. Top link uses position:fixed.
Responsive design	Viewport meta on every page. A media query at 600px changes the books to one column and reduces main padding. Navigation can wrap.
Bootstrap bonus	Local Bootstrap CSS styles buttons with btn / btn-success and form controls with form-control / form-select. Custom CSS is loaded afterwards.

5. How the code works

HTML contains the content and structure. The same header and navigation are repeated in each file so each page can open independently. CSS changes how the elements look. No JavaScript, database or build system is used.

The navigation links are relative filenames. The image and sound are local files. Flexbox places the navigation links next to each other. Grid places the two book articles in equal columns; the media query changes them to one column on narrow screens.

The joining form is a demonstration, not a real registration system. Browser validation checks required fields, email format, password length and number limits. Submit reloads the Join page at the demo note. Personal fields have no name attribute, so their values are not added to the URL. The radio buttons share a name so only one can be selected.

6. Validation and screenshot status

Static checks confirmed that the four HTML files exist, internal file references resolve, labels point to the intended controls and all required input types are present. Local media and Bootstrap are included in the ZIP.

Desktop and phone screenshots are still required before submission. Browser execution was unavailable in the preparation environment, so no screenshots or successful browser tests are claimed. Capture each page at a desktop width (for example 1366px) and a phone width (for example 390px), then add the eight images to the report. Also check links, audio, form validation and horizontal scrolling in your browser.

7. References and asset notes

MDN, Structuring content with HTML:
developer.mozilla.org - HTML learning guide

Bootstrap, Getting started:
getbootstrap.com/docs/5.3/getting-started/introduction/

The book illustration and chime are original project assets. Bootstrap is a third-party library; its license is included in vendor/Bootstrap-LICENSE.txt. The website is an educational example and does not represent a real club registration service.
